

# MP101 - Manufacturing Processing

## Lab #1 Mechanical Properties of Materials

Name: \_\_\_\_\_ Lab Section: \_\_\_\_\_ Date: \_\_\_\_\_

**Objective:** To acquaint the student with the procedure associated with determining the basic mechanical properties of materials by tensile testing and hardness testing.

### **Part A: Tensile Test**

#### **Procedure:**

1. Observe the setup for Tensile Testing as demonstrated by the instructor.

2. Record the following pre-test data:

- a. Specimen material \_\_\_\_\_
- b. Initial diameter  $D_o =$  \_\_\_\_\_ in
- c. Initial gage length  $L_o =$  \_\_\_\_\_ in

3. Record the following observed test data:

- a. Final diameter  $D_f =$  \_\_\_\_\_ in
- b. Final gage length  $L_f =$  \_\_\_\_\_ in

#### **Analysis:**

1. Obtain a copy of the Force-Strain curve and determine the following calculated data (See formulas on page 2):

- a. Initial cross sectional area  $A_o =$  \_\_\_\_\_ in<sup>2</sup>
- b. % elongation  $\%elong =$  \_\_\_\_\_ %
- c. 0.2% Offset yield strength  $S_y =$  \_\_\_\_\_ psi
- d. Ultimate strength  $S_u =$  \_\_\_\_\_ psi
- e. Modulus of Elasticity  $E =$  \_\_\_\_\_ psi
- f. Breaking Strength  $S_b =$  \_\_\_\_\_ psi

## **Part B: Hardness Testing**

### **PROCEDURE:**

- 1) Set up and take Rockwell Hardness readings for 2 different items or materials (as given by instructor). Compare readings between the A and B scales.  
(Take 5 readings on each scale, each item, then take the average.)

Set up and take Brinell Hardness readings for the same 2 different items (as given by instructor).

Material	Rockwell R <sub>A</sub>	Average	Rockwell R <sub>B</sub>	Average	Brinell BHN

- 2) Compare the Rockwell R<sub>A</sub> and R<sub>B</sub> average readings, do they agree with the hardness reading comparison chart?

Compare the values between Brinell Hardness to the Rockwell B hardness.

How do the values on the hardness reading comparison chart relate to the values of the tensile test?

### **Formulas**

1. Initial cross-sectional area (A<sub>o</sub>)  $A_o = \left(\frac{\pi}{4}\right) D_o^2$
2. % elongation  $\% \text{elong} = \left(\frac{L_f - L_o}{L_o}\right) \times 100$
5. Modulus of Elasticity (E): Let  $\sigma$  = Stress and  $\epsilon$  = Strain

$$E = \frac{\sigma_2 - \sigma_1}{\epsilon_2 - \epsilon_1}$$
