

# Evidence-Based Group Project

## Instructions:

### Introduction:

The purpose of this project is to provide students an opportunity to collaborate with other students in an assigned group to identify an observed nursing practice or issue and compare observations with current evidence and published practice standards. This evidence based scholarly clinical project is a thought-provoking 30-minute group presentation and will be presented during a clinical conference at your clinical site to other members in your clinical group, clinical faculty and nursing staff if available. Clinical faculty will grade the group project presentation using the rubric below. All students within a group are expected to have equal participation and all students within a group will receive the same grade for this assignment.

This may be a procedure, policy, protocol, skill or issue noted in practice on your unit during the NUR 291 clinical rotation for quality and safe patient care (QSEN).

### Some examples of topic areas are:

End of life/palliative care issues

Vulnerable populations

Cultural diversity issues

Patient non-adherence to therapeutic regimen

Procedural or policy issues
