ARIS APP INSTALLATION GUIDE

Getting Started: Installing the ARIS App

Simulations are currently designed only for iOS iPad and iPhone devices. The ARIS software that the ARISE simulations use is available on the iTunes App Store: http://itunes.apple.com/us/app/aris/id371788434

Step One: Get the ARIS App

You can either click the “Available on the App Store” button above, or open the App Store and search for “ARIS”

When the search is set, you should see something like this:
Step Two: Open the ARIS App

When you open the ARIS App, you will see a screen like this. Touch the ghost image of the QR code to scan the code on the title page.
You will see a screen like this, just aim your iPad camera at the code on the page to load the scenario.

Step Three: Select a Scenario

Each title page will have a QR code that can be scanned to load a scenario.
Note: Sometimes the ARIS app will require you to take a selfie (Take a Public Player Image) and enter a user name when it is opened. This usually occurs after a scenario is aborted before finishing or for other reasons was forced to quit.

When this occurs, you must take the selfie photo by touching the round button image below the photo, then touch Use Photo, Enter some text when the keypad appears, touch ‘Return’, then touch ‘Save’.

You will see a menu of games and up at the top next to the ARIS title, 3 horizontal bars in an icon to the left. This is the Menu icon. Touch this and select ‘< Log Out’ at the bottom of the screen.

The App is now reset to the main screen. You should now see the ARIS Login Screen and can scan a code to start a scenario.
